

Abstract**ROBUST ENCRYPTION AND DECRYPTION OF PACKETIZED DATA
TRANSFERRED ACROSS COMMUNICATIONS NETWORKS**

5 A method for improving fault tolerance and data throughput rates in the
transfer of data between computing entities across a virtual private network
comprises the steps of: logically dividing a memory means associated with a first
said communicating entity into a plurality of areas; receiving encrypted data from
said second communicating entity; storing said encrypted data in the first
10 memory area associated with said first communicating entity; writing said
encrypted data stored in said first memory area into a second memory area
associated with said first communicating entity; decrypting said encrypted data
stored in said second memory area; and writing said decrypted data from said
second memory area to said first memory area.
